Autodesk, Inc. v. Accenture Ltd. Prior to 2004, the usual practice was for students in engineering and architecture schools to do all of their design work in CorelDRAW. Recently, there have been many innovations in CAD software, such as Inventor, Dreamweaver, and others. Some CAD programs have become very powerful, with tools that rival the power of CAD software. Another feature of CAD software is that the underlying design work and review is done on a computer and not on paper. For the typical design engineer, this has meant that work can be done in any location. This convenience has its drawbacks, as well. Many

large firms still rely on paper documents to carry over designs and specifications. The traditional top-down view of CAD is usually a 2D design. Drawings done this way are often quite complex. 3D designs can be done, but they require a lot of manpower and money to create. CAD software allows design engineers to create complex 3D models and parts with ease. This provides a lot of convenience for these engineers and other users. These 3D models can then be used in different design applications to create tools, manuals, drawings, videos, or any other physical product. CAD programs allow the user to combine separate designs and parts into a whole new model. Design engineers use different techniques to create these complex parts.

They can model the part as a 3D shape, use different types of solids and surfaces, then put them together using Boolean operations to build a complex model. 2D drawing, sometimes called “paper design” 3D design, sometimes called “model design” Brief History of CAD Software Traditional 2D Drawing Design engineers traditionally draw designs by creating views of a 2D model on paper. To create a new model, a design engineer needs to draw the view over and over again. Often, the engineer will have to draw multiple views of the model, to understand the model better and to ensure that the design is correct. These drawings can then be taken to the manufacturing process. The drawings can also be used to create tooling and to create manuals.

3D Design A different approach to creating 2D designs is through the use of 3D modeling. With this type of model, the user starts with a 3D shape and creates views of that model on paper. As you can see, both traditional 2
